Energy storage system voltage to ground

Overview

For dwelling units, an ESS cannot exceed 100 volts between conductors or to ground. An exception dictates that where live parts are not accessible during routine ESS maintenance, voltage exceeding 100 volts is permitted at the dwelling unit energy storage system. Why is battery energy storage moving to higher DC voltages?

Battery energy storage moving to higher DC voltagesFor improved efficiency and avoided costsThe evolution of battery nergy storage systems (BESS) is now pushing higher DC voltages in utility scale applications. The Wood Mackenzie Power & Renewables Report is forecasting phenomenal growth.

How many volts can a dwelling unit energy storage system handle?

For dwelling units, an ESS cannot exceed 100 volts between conductors or to ground. An exception dictates that where live parts are not accessible during routine ESS maintenance, voltage exceeding 100 volts is permitted at the dwelling unit energy storage system. This information can be found at 706.30 (A).

What is an energy storage system?

An energy storage system consisting of batteries installed at a single-family dwelling inside a garage. Article 706 is primarily the result of the work developed by a 79-member Direct Current (DC) Task Group formed by the NEC Correlating Committee.

What is required working space in and around the energy storage system?

The required working spaces in and around the energy storage system must also comply with 110.26. Working space is measured from the edge of the ESS modules, battery cabinets, racks, or trays.

Does a non-galvanically isolated battery have a common ground?

The challenge that this presents is that if you put a non-galvanically isolated

electronic device between the battery and the PV, it means these two system components must have a common ground, which is not at all the case when the PV is grounded and the battery is floating.

Are energy storage systems connected to other energy sources?

Energy storage systems can be (and typically are) connected to other energy sources, such as the local utility distribution system. There may be one or more sources connected to an ESS. The connection to other energy sources is required to comply with the requirements of 705.12.
