Home power outage backup solar lights

Overview

Should you use a solar battery during a power outage?

For true peace of mind during a power outage, you can't beat a solar battery system. There is nothing quite like the feeling of being the only house on the block with the lights on after the grid goes down—although the more altruistic among us would prefer that all our neighbors had the same luxury.

How do you light a home during a power outage?

A neat trick to light your home during a power outage is to gather your outdoor solar lights and bring them indoors. Small stake lights can be placed in a large jar to create a bouquet of light. Larger lights can stand alone. String lights can be hung up where you need light most or placed in a reflective bowl to diffuse the light.

How do you keep solar lights on during a blackout?

Typical home solar installations shut down during a blackout, but you can keep the lights on in 1 of 3 ways: a generator, battery, or a special solar inverter.

Can a solar inverter keep your power on in a blackout?

To keep your power on in a blackout, you need a solar inverter that can remove your home from the grid, along with a generator or battery for longer-term energy needs. By creating your own little “island” of a home with solar panels and batteries, you can run essential appliances for days during a power outage.

Does your house get solar power in a blackout?

But that also means your house doesn't get the solar power, either. In a blackout situation, the power from your solar panels goes nowhere - unless you have some way of storing the electricity (with a battery) or otherwise cutting your system off from the grid.

Can a solar generator run during a blackout?

While the blackout remains in effect, your little solar island will charge the batteries during the day and discharge them at night. As long as you have enough battery capacity, you could keep running like this through a very long power outage.
