How much electricity does the 5G base station in Vaduz use

Overview

Today we see that a major part of energy consumption in mobile networks comes from the radio base station sites and that the consumption is stable. We can also see that even in densely deployed networks, as i.

How much power does a 5G station use?

The power consumption of a single 5G station is 2.5 to 3.5 times higher than that of a single 4G station. The main factor behind this increase in 5G power consumption is the high power usage of the active antenna unit (AAU). Under a full workload, a single station uses nearly 3700W.

Which network consumes the most power in 5G?

Also, NextGalliance published a report with the below figure clearly illustrates that the RAN consumes the most power. Although RAN power consumption is reduced in 5G, it is still over 50% of the total 5G network infrastructure consumption. Another trend worth noting is the rise in data center power consumption in 5G.

Why does 5G use more power than 4G?

The data here all comes from operators on the front lines, and we can draw the following valuable conclusions: The power consumption of a single 5G station is 2.5 to 3.5 times higher than that of a single 4G station. The main factor behind this increase in 5G power consumption is the high power usage of the active antenna unit (AAU).

How much power does a BBU use?

Data shows the power of the BBU is relatively stable and is affected very little by the workload, while AAU is opposite, with power consumption growing as the load increases. With S111 configuration and 100% load, the power consumption of a single station can even reach 3852.5W.

Why does a ran consume more power than a 4G network?

Despite improvements in energy efficiency, the RAN continues to consume

more power than any other part of the network. This is due largely to new technology like mmWave transceivers and MIMO antennas, all of which require more power. Power Consumption of 4G and 5G Networks How can 5G reduce power consumption Vs. 4G.

What is a 5G base station?

A 5G base station is mainly composed of the baseband unit (BBU) and the AAU — in 4G terms, the AAU is the remote radio unit (RRU) plus antenna. The role of the BBU is to handle baseband digital signal processing, while the AAU converts the baseband digital signal into an analog signal, and then modulates it into a high-frequency radio signal.
