# Power station generators flooded

✓ IP65/IP55 OUTDOOR CABINET

✓ OUTDOOR MODULE CABINET

✓ OUTDOOR ENERGY STORAGE CABINET

✓ 19 INCH

## Overview

---

How to fix a flooded generator?

To fix a flooded generator, you should first consider drying the spark plugs, which are often affected when the engine floods. Flooding causes excess liquid fuel to enter the engine, wetting the spark plugs and preventing them from igniting.

Can a generator cause engine flooding?

Generators can cause engine flooding. If a generator keeps flooding, you should dry the spark plugs of any excess fuel preventing them from igniting.

How can I tell if a generator engine is flooded?

A flooded generator engine can be identified by checking if the spark plug is wet or if the engine keeps stuttering without igniting. Both signs indicate that the engine is faulty and requires fixing. Keep reading this article to determine how to resolve this issue, what causes generator engines to flood, and the best way to prevent flooding.

Should you dry spark plugs after a flooded generator?

When dealing with a flooded generator, drying the spark plugs is necessary. Flooding causes excess liquid fuel to enter the engine, which wets the spark plugs and prevents them from igniting. By drying the spark plugs, the generator can combust the fuel and start.

What precautions should you take when fixing a flooded generator?

When fixing a flooded generator, you should always power off the generator before disassembling it to prevent a fire accident. Keep any flame sources away from your work area because you'll be handling flammable fuels.

Why won't my generator start?

If your generator won't start, consider cranking the engine a few times first. Cranking the system without the spark plugs allows air to get in and dry the carburetor. You can then return the spark plugs and try restarting the generator. Another step you can take is replacing the fuel.
