Solar System Types

Overview

What are the different types of objects in the Solar System?

The solar system includes numerous small objects, generally classifiable as asteroids, comets, or inter-planetary dust. Asteroids and comets are of considerable importance in the study of the terrestrial planets.

How many planets are in our Solar System?

Pluto (lower right) and its biggest moon Charon (upper left). Composite of images taken by New Horizons on July 14, 2015. Image by NASA. Unless you're pretty young, you learned in school that our solar system consists of nine planets.

What is the Solar System made up of?

The solar system is made up of all the planets that orbit the sun, but the solar system also has moons, comets, asteroids, minor planets, dust and gas; everything in the solar system actually orbits or revolves around the sun. The sun contains around 98% of all the material in the solar system.
